

Instructions for "Yaesu FT-1000MP Mark V" to transmit out of band

Here Is a Mod I talked out of YAESU Not sure if you have this one, But it works There is the "60- meter" band which I do not think the Mark V will cover normally. That is one good place to use it. Plus, since I have commercial experience, where the "6-Meg" commercial band is great...! So the "60-meter, 5.4 Mhz band..." should be a very close dupe of the "6-Meg" commercial band.

1. Confirm first... that the transceiver IS NOT transmitting outside of the band.
 2. Press "Power on..." while Pressing "Fast & Lock keys..." simultaneously.
 3. Then, go to "Xpanded Menu 9 - 9".
 4. Then, Press "Fast and the Enter key".
 5. Turn the "RF/Memory knob "VRF/Memory Channel knob" to "Function 9 - 9".
 6. You will see selection name: "t-Select".
 7. Turn the "Main VFO A" counter C.W. until you find "Gen".
 8. Then, Press the "Enter Key".
 9. You're Finished...
- End..
